Genes were identified by a combination of three methods: Gene prediction programs including GRAIL (ftp://arthur.epm.ornl.gov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://arthur.epm.ornl.gov/pub/xgrail), Genefinder (Phil Green, University of Washington), Genscan (Chris Burge, http://www.cbs.dtu.dk/services/NetGenee/), searches of the complete sequence against a peptide database and plant EST databases at TIGR, and manual curations based on those analyses. Annotated genes are named to indicate the level of evidence for their annotation. Genes with similarity to other proteins are named after the database hits. Genes without significant peptide similarity but with EST similarity, that are predicted by two corners without protein or EST similarity, that are predicted by two annotated as 'hypothetical' proteins. Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Genes encoding tRNAs are predicted by tRNAscan-SE (Sean Eddy, Simple repeats were identified by repeatmasker (Arian Smit, http://genome.washington.edu/RM/RepeatMasker.html). Genes are numbered from the top to bottom of the chromosome.
                                                                                                                                                                              Bukaryota: Viridiplantae; Embryophyta; Tracheophyta; Spermatophyta; Magnollophyta; eddicotyledons; core eudicots; Rosidae; eurosids II; Brassicales; Brassicaceae; Arabidopsis.

In addition, we would like to thank the TIGR Bioinformatics Department, especially Lixin Zhou, Hanif Khalak, Michael E. Heaney, Lily Fu, Feng Liang, Jeremy Peterson, Michael Holmes, and Delwood Richardson for software and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Submitted (09-MAR-2000) The Institute for Genomic Research, 9712 Medical Center Dr., Rockville, MD 20850, USA On Dec 17, 1999 this sequence version replaced gi:2642152. The sequence and annotation of chromosome 2 were merged from those of the individual clones on this chromosome after removing overlaps. For detailed information, please see the TiGR web site (http://www.tigr.org/tdb/at/at.html).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence and analysis of chromosome 2 of the plant Arabidopsis
Arabidopsis thaliana chromosome II section 214 of 255 of the complete sequence. Sequence from clones T517. AC003000 AE002093
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This work was supported by the National Science Foundation. ribosomal RNA DNA

L.ml6SRDNX 1418 bp L.meyeri gene for 16S 221648

LOCUS DEFINITION

GI:433585

221648.1

ACCESSION VERSION KEYWORDS SOURCE

ORGANISM

16S ribosomal RNA. Leptospira meyeri. Leptospira meyeri Bacteria; Spirochaetales; Leptospiraceae; Leptospira.

The gene has been designated the parkin gene, and variants of it are implicated in the pathology of Parkinson's disease, and found in parkinson's disease patients. The sequences may be used for the diagnosis, treatment (including gene therapy) and investigation of
              This sequence represents a Leptospira DNA sequence isolated from the pathogonic Leptospira (LS) bacterium of the invention. The bacterium belongs to serogroup Hurstbridge or serovar hurstbridge or the species L. fainei. The LS bacteria can be used for conferring protective immunity against pathogenic LS bacteria in humans or animals. The bacteria can also be used for prophylactic or therapeutic treatment of infections. The DNAs and antibodies may also be used for detection and

with monocytes. Some of the transcripts correspond to known genes or ESTs (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell other transcripts correspond to novel genes. Antigen-presenting cell chart transcripts correspond to novel genes. Antigen-presenting cell cativation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MMC (major histocompatibility complex) and subsequent recognition by 7-cell receptors is alone insufficient activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic 7-1ymphocytes (CTLs). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly gainst a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in CC an APC; and as hybridisation probes/amplilication primers for the capnormal corresponses belonging to the monocyte lineage. Cells containing these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to abnormal corresponding to the monocyte lineage. Cells containing these genes are used in active immunotherapy (or to stimulate production of a copulation of antigen-specific effector cells) and become antigen specific effectors ensures adequate antigen sond APC-associated costimulatory factors ensures adequate antigens and Presentation of co-stimulatory signals, migration to rodegenous APCs and upregulates the APCs for the correction of I cell growth factors and secretion of chemokines for recruitment of immune effector cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

that are preferentially transcribed in the metastatic breast tumour calls.

that are preferentially transcribed in the metastatic breast tumour calls.

to 286677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour calls.

these transcribes can be used for diagnosis, prognosis, monitoring and transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions.

Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antispen-encoding sequence for use in gene or call-based vaccines; for diagnosing breast cancer and for raising specific continuously an antispense ancoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antispense used for adoptive for immunothers.
                                                                                                                                                                                     280767 to 283941 represent tags corresponding to distinct transcripts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         οy
                                                                                                                                                        that are preferentially transcribed in the metastatic breast tumour colls. 283941 represent tags corresponding to distinct transcribts that are preferentially transcribed in metastatic breast tumour colls. 283942 to 286677 represent tags corresponding to distinct transcribts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcribts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic biagnosis is by standard immunosasys or hybridisation/amplification reactions. Compounds that modulate expression of the transcribts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based cancernes polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic genes; cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter colls.

that are preferentially transcribed in the metastatic breast tumnour cells.

that are preferentially transcribed in the metastatic breast tumnour cells.

that are preferentially transcribed in metastatic breast tumnour cells). 283942

to 286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumnour cells).

trissue (i.e. are downregulated in metastatic breast tumnour cells).

These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression of the transcripts are potentially compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, or e.g. therapeutic genes (also ribozymes or antisense sequences).

Compounds that an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for adoptive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           target mRNA; identification; diagnostic; therapy; ss.

                                                                                                                                                                                                                                                                                                                     8
                                                                                                                                                                 This invention describes a novel method allowing essential or functional genes to be rapidly identified and inactivated. The method is able to firstly identify most of the essential genes in an organism (1.e. a bacteria or a eukaryote) needed for survival, and secondly it provides for reducing or inactivating their expression. The method is able to lagnostic reagents and therapeutics. The method provides a means for identify functional oligonucleotide molecules able to be used as diagnostic reagents and therapeutics. The method provides a means for identifying essential genes whose sequence is known only as part of a genome with unknown function, as well as a means for identifying conciler acid molecule comprising (a) a first reporter gene encoding a nucleic acid molecule comprising a protein of interest (itself translated from an RNA of interest) and a reporter protein, a second reporter gene encoding a concoling a second reporter protein, and (c) a targeting gene encoding a concoling a concoling molecule such as an external guide sequence (EGS), a ribozyme or an antisense RNA and targeted to the RNA of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

They are used especially for the treatment of the immunosuppressive effect of TGF-beta, augmentation of the proliferation of cytotoxic lymphocytes, treatment of endogenous hyperexpression of TGF-beta, treatment of endogenous hyperexpression of TGF-beta, reatment of preast tumours, neurofibromas and malignant gliomas, including glioblastomas, treatment and prophylaxis of skin carcinogenesis, and treatment of oesophageal and gastric carcinomas.
                                                                                                                       The sequence is that of a polynucleotide probe which may be used in the detection of new hypervariable regions (HVR) in a DNA sequence. HVR represent a fingerprint useful in e.g. forensic science, paternity testing, animal breeding, etc. The probe may be used as part of a method for the efficient detection in humans or other animals, without the use of mini-satellites or primary enrichment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                tumour; anglogenesis; breast tumour; neurofibroma; glloma; glloblastoma; carcinogenesis; carcinoma; oesophagus; oesophageal; gastric; gut; immunosuppression; oligonucleotide; ss.

```
The present invention describes enzymatic nucleic acid molecules with RNA-cleaving activity (e.g. ribozymes) which are capable of modulating the expression of plant genes: (i) involved in biosynthesize or (ii) involved in flower formation. V9598 to V9634, and alrabids: or (ii) involved in flower formation. V9598 to V96334, and V96335 to V96335 to V96334 represent potato solanidine glucosyltransferase v96335 to V96334 represent potato solanidine glucosyltransferase target V96355 to V96734 represent potato solanidine glucosyltransferase target sequences. V96734 to V9710, and V97171 to V97195 represent potato citrate synthase hammerhead and hairpin ribozymes, respectively. V96735 citrate synthase hammerhead and hairpin ribozymes, respectively. V96735 citrate synthase hammerhead and hairpin ribozymes of the present potato citrate synthase target to V96772, and V97196 to V97220 represent potato citrate synthase target sequences. Ribozymes of the present invention can be used to inhibit spectob but also tomato, pepper, aubergine and ditura or to inhibit for potato but also tomato, lettuce, spinach, cabbage, brussel sprouts, flowering in potato, lettuce, spinach, cabbage, brussel sprouts, flowering in potato, lettuce, spinach, turnip, sweet potato and turf arso the ribozymes can be used for RNA manipulation in the same way that restriction endonucleases are for RNA manipulation in the same companied of the present of the present of the commine way that restriction endonucleases are for DNA, as well as to examine
                                                                                                                                                                                                                             ;

V48709-886 represent antisense oligonucleotides directed against the CETAB-2 gene. Of these, only oligonucleotides V48709-91 resulted in significant redcution in ErbB-2 protein expression, while considered value of the significant redcution in ErbB-2 protein expression, while colliquoucleotides V48792-886 had little effect. The oligonucleotides v48792-886 had little effect. The oligonucleotides colliquoucleotides v48792-886 had little effect. The oligonucleotides consecution. The specification describes oligonucleotides that contain three hydrogen bonds to cytosine; do not contain four consecutive exptosines; do not contain two sequences of three consecutive consecutive cytosines; do not contain two sequences of three consecutive cytosines, and the ratio between residues able to form two H-bonds each cytosines, and the ratio between residues able to form two H-bonds each cytosines, and the ratio between residues able to form two H-bonds each colliquous clottides are used to modulate expression of genes, particularly colliferation of primary cell cultures (e.g. bone marrow stem, liver or proliferation of primary cell cultures (e.g. bone marrow stem, liver or proliferation cells, osteochasts, osteochasts, osteoblasts and/or keratinocytes). The colligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases considered the consecution of proteins of consecution of cancer or (targeting TGF) for stimulating the immune system.
                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate
ribozymes can be targeted to specific genes or to consensus sequences within a family of related genes, and being catalytic need to be present at only very low concentrations.
                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ErbB-2; antisense oligonucleotide; modulate; gene expression; ss.

The state of these, only oligonal colleges used and state of these, only oligonal colleges used and state of these, only oligonal colleges with the state of these, only oligonal colleges with the invention. The specification describes oligonal colleges can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive nucleotides able to form three H-bonds each to four consecutive cutosines; do not contain two sequences of three consecutive cutosines; and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines, and the ratio between residues able to form two H-bonds each (2R) or three such bonds (3R) is given by 2R/3R = 0.33-0.72. The cytosines are used to modulate expression of genes, particularly the genes for p53, EEB-2, junb, junb, 7GF-beta 1 or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoblasts and/or keratinocytes). The coligonacleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive quancisine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl Nydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. A16735 to 6 A17167 and A17622 represent ribozyme sequences for ANT and A17621 to A17682 to A18785 and A1987 to A197814 represent their corresponding target sequences; A19723 to A19222 represent their corresponding target sequences; A19735 to A19222 represent their corresponding target sequences; A18786 to A21861 and A21895 to A22475 and A22363 to A23342 represent their corresponding target sequences; A18785 to A21895 to A21895 to A22475 and A22363 to A23363 to A23362 to A23363 to A23365 to A23425 represent their corresponding target sequences; A23262, A23343 to A23262 to A21895 to A22475 and A22363 to A23362 to A23362 to A23422 represent their corresponding target sequences. The ribozymes sequence for integrin subunit beta 3, and A22476 to A32362, A23343 to A23422 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding anglogenic factor. Tie-2. They are especially used to treat cancer, diabetic retinopathy, as meovascular degeneration (RNMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, soriasis, verruca vulgaris, angiofibrome of tuberous sclerosis, pot vulgaris, angiofibrome of tuberous sclerosis, other wheber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; aryl hydrocarbon nuclear transport; ARNT; TIE-2; anglogenesis; integrin alpha 6 subunit; integrin subunit beta 3; hairpin ribozyme; hammerhead ribozyme; anglogenic factor; cytostatic; antidabetic; ophthalmologic; antidiflammatory; antiarthitic; antipsoriatic; ARND; dermatological; RNA cleavage; cancer; diabetic retinopathy; arthritis; age related macular degeneration; inflammation; neovascular glaucoma; myopic degeneration; psoriasis; veruca vulgaris; anglofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; Osler-Weber-Rendu syndrome; ss.

The method acomprises: (a) introducing into the system a random library of nucleic acid catalysts (NAC) having a substrate binding domain (SBD), comprising a random sequence, and a catalytic domain (CD); and (b) identifying NAC in systems where modulation has occurred and/or determining the sequence of at least part of the SBDs in such systems. Nucleic acid molecules with endonuclease activity and catalytic activity, from the present invention, are used to modulate gene expression in plant and mammalian cells and to cleave target nucleic acid, particularly for treating systemic. diseases caused by specific RNA, e.g. cancer, inflammation, psoriasis, non-hepatic ascites and infection. They may also be used to detect genetic drift and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in the HIV protease gene. The method of detection allows the simultaneous characterisation of a range of codons involved in drug resistance using sets of probes optimised to function together in a reverse-hybridisation assay. 297517 to 297997 represent specifically claimed probes for use in the assay, and 297479 to 297501 represent specifically claimed HIV protease gene polymorphic nucleotide sequences. 297502 to 297515, and 297516 represent PCR primers for the HIV protease gene, and 297516 represents an HIV protease probe used in an example from the present invention. The method, probes and primers can be used for the method allows the simultaneous characterisation of a range of codons involved in drug resistance. The method may also be used for HIV protease genotyping assays. The probes are able to discriminate between protease genotyping assays. The probes are able to discriminate between
mutations in diseased cells and to determine c-raf RNA. Specifically NACS with RNA-cleaving activity that modulate expression of the Raf gene, are used to treat cancer, restenosis, psoriasis or rheumatoid arthritis, or generally any condition associated with the level of c-raf. Introduction of sugar/phosphate modifications increases stability against nuclease and activity. V90922 to V93877 represent NACs that can be used in the method, specifically for modulating the expression of a Raf gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes the detection of drug-selected mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of drug-selected mutations in the HIV protease gene used to treat HIV infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      wild type and mutated protease sequences. The method allows rapid and reliable detection of drug-selected mutation in HIV.
                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                           ..
